

## Profisil 1906

Silicate interior paint, low-emission, solvent- and plasticizer-free, dull matt, wet abrasion resistance R-class 2, suitable for allergy sufferers, for interior use

Color System

### Field of application

For high-quality ceiling and wall coats, e.g. interior plaster, concrete and sand-lime brickwork. Particularly suited for silicifying mineral substrates. The complete coating build-up has also been tested in combination with Brillux woodchip wallpaper and is suitable for allergy sufferers.

### Properties

- preservative-, solvent- and plasticizer-free, low-emission
- Complies with the requirements of the Committee for the Health-related Evaluation of Building Products (AgBB)
- Free of fogging-active substances
- Silicate dispersion paint in accordance with DIN 18363
- Highly diffusible, corresponds to Class I in accordance with DIN EN ISO 7783
- Low odor
- Can be processed in airless spray application
- Bonds to the substrate by silification

### Material description

<b>Colors</b>	0095 white A number of additional color shades can be mixed with the Brillux Color System.
<b>Base material</b>	Potassium water glass with organic stabilizers
<b>Organic content</b>	< 5% in accordance with DIN 18363, 2.4.1.1
<b>Density</b>	approx. 1.5 g/cm <sup>3</sup>
<b>Ph value</b>	approx. 11
<b>Classification according to EN 13300</b>	Wet abrasion resistance: R-class 2 Contrast ratio: H <sub>10</sub> -class 1 (at 7 m <sup>2</sup> /l) Gloss: G4 dull matt Maximum grain size: S1 fine

## Material description

<b>Reaction to fire</b>	A2 – s1,d0 in accordance with DIN EN 13501-1 (“nichtbrennbar”, non-combustible), in accordance with classification report no. 230011570-3 In system build-up with Briplast filler material according to classification report no. 230010838-3.
<b>Water vapor permeability</b>	Diffusion-equivalent air layer thickness: $S_d (H_2O) < 0.03$ m, in accordance with DIN EN ISO 7783, corresponds to Class V <sub>1</sub> “highly water-vapor-permeable” in accordance with DIN EN 1062-1
<b>Water vapor diffusion current density</b>	$P \geq 2000$ g/m <sup>2</sup> d
<b>Packaging</b>	0095 white: 2.5 l, 5 l, 10 l, 15 l Color system: 2.5 l, 5 l, 15 l

## Use

<b>Dilution</b>	Where necessary, with a mixture of Fondosil 1903 and water (mixing ratio 1:1).
<b>Tinting</b>	Tintable up to max. 25 % with Full Color and Tinting Paint 951. Note that the color shades dry lighter.
<b>Compatibility</b>	Can only be mixed with similar materials and those specified in this data sheet.
<b>Application</b>	Before use, stir thoroughly with an electric stirrer. Profisil 1906 can be applied by using a brush, roller and airless spray application.
<b>Consumption</b>	Approx. 130-150 ml/m <sup>2</sup> per layer. Determine the exact consumption by means of a test application on the object to be coated.
<b>Application temperature</b>	Do not apply at an air and object temperature below +8 °C.
<b>Cleaning tools</b>	Clean tools immediately after use with water.

## Spray data

Spray system	Nozzle	Spraying angle	Pressure	Dilution
High-performance airless system	0.021–0.027 inch	40°–80°	depending on the spraying device and individual requirements	5-15 %

## Drying (+20 °C, 65% relative humidity)

Surface-dry and can be processed after approx. 4 -6 hours. Final silification after several days. Allow longer drying times at lower temperatures and/or higher air humidity.

## Storage

Store in a cool and frost-free place. Reseal opened containers tightly.

## Declaration

<b>Note</b>	Do not inhale spray mist.
<b>Product code</b>	BSW10 Comply with the specifications in the current Safety Data Sheet.

**Substrate pretreatment**

The substrate must be solid, dry, clean, load-bearing, and free from efflorescence, sinter layers, separating agents, corrosion-promoting, or other intermediate layers affecting the adhesion. Check existing coatings for their suitability, load-bearing capacity, and adhesive properties. Thoroughly remove defective and unsuitable coatings and dispose of them in accordance with the applicable regulations. Thoroughly rinse off reversible, water-sensitive coats (e.g. limepaint). Treat replastered areas with a fluorine primer, over the entire area for colored coatings. Apply a prime and/or intermediate coat to the substrate as required. Also see VOB Part C, DIN 18363, Section 3.

**First and renovation coats**

Substrates	Prime coat	Intermediate coat <sup>3)</sup>	Top coat
Normally absorbent substrates, e.g. interior plaster (compressive strength category CS I–CS IV) <sup>1)</sup>			
Brillux woodchip wallpaper 31, 51 and 71			
Intact, matt emulsion paint coats		Profisil 1906, thinned where necessary	
Highly absorbent substrates, e.g. interior plaster (compressive strength category CS I–CS IV) <sup>1)</sup> , concrete, sand-lime brickwork, intact silicate paint coats	1–2x wet in moist Fondosil 1903 and water in mixing ratio 1:1		Profisil 1906
KlimAir system build-up with KlimAir Panel 1866 <sup>4)</sup>			
Intact, gloss emulsion color coatings	Adhesion Primer 3720		
Gypsum plaster (compressive strength category B1–B7), gypsum plasterboard, gypsum wallboard	Wall Primer 3729 or Wall Primer coarse 3728 <sup>2)</sup>	Depending on the individual requirements, Profisil 1906, thinned as required	

<sup>1)</sup> Minimum compressive strength > 1,5 N/mm<sup>2</sup>

<sup>2)</sup> Prime soft and highly absorbent filler zones and substrates with Lacryl Deep Penetrating Primer 595 as part of the substrate preparation.

<sup>3)</sup> If filling or texturing properties are required, use Silicate Brush-On Filler 3639 or Klimasil 1908 as an intermediate coat.

<sup>4)</sup> Follow the instructions on the data sheets of the following products for information on the KlimAir system build-up: KlimAir Panel 1866 and KlimAir Adhesive Plaster 1868.

<b>Mask surfaces</b>	Mask the surroundings of the surfaces that are to be coated carefully, especially glass, brick and natural stone.
<b>Cracks and flawed areas</b>	Fill cracks and indentations flush with surface after priming with a fillable mixture of silicate paint and quartz sand. Re-prime filled areas. Re-plaster larger flawed areas in the substrate.
<b>Smoothing rough surfaces</b>	Smooth rough surfaces before the coating build-up by filling them with, e.g. Briplast Silafill 1886, as required.
<b>Reaction with the substrate</b>	For renovation coats on watery coatings, allergenic substances present in the substrate may be activated due to the moisture impact in rare cases. We therefore recommend applying a test coat to check whether such reactions occur.
<b>Coating on gypsum plasters</b>	For gypsum plasters with high absorbency, an adequate stabilization is not always achieved. We recommend checking the adhesion of the complete coating build-up with an adhesive tape test (e.g. Tesa Precision Masking Tape, gold 4334) to ensure a reliable assessment. Deep penetrating primer should be used where necessary.
<b>Discolorations of gypsum plasterboard</b>	An additional sealing coating should be applied if there is a risk of discolorations penetrating through the untreated gypsum plasterboard. Use e.g. Isolating Primer 924 for this depending on the situation on site. For an accurate assessment, sample coatings of various panel widths, including the joints and filled areas, have proven to be useful.
<b>Gypsum fillers on gypsum plasterboard</b>	The gypsum fillers recommended by gypsum plasterboard manufacturers can be particularly susceptible to moisture, which can result in swelling, bubble formation, and flaking (see also Data Sheet 2 "Filling of gypsum plasterboards, surface qualities" Trade Association of the German Gypsum Plasterboard and Wallboard Industry). It is therefore important to ensure adequate ventilation and appropriate temperatures for rapid drying.
<b>Compatibility with sealing compound</b>	When coating sealing compounds, e.g. acrylic sealing compounds, cracks may occur in the coating material due to the higher elasticity. Discolorations may also occur in the coating. Due to the wide range of sealing compounds available on the market, self-tests must be carried out to assess the adhesion and the processing result in each individual case.
<b>Repairs</b>	Surface repairs are more or less strongly apparent depending on the situation on site. This is unavoidable according to BFS Data Sheet No. 25, Point 4.2.2.1, Section e.
<b>Surface irregularities after drying</b>	Due to the chemical curing process, different discolorations and surface irregularities may occur in unfavorable object parameters, combined with e.g. uneven substrate absorbency, differences in substrate humidity and alkalinity or ingredients in the substrate. This does not constitute a technical-functional defect and does not justify complaint.

## Notes

**Use in incidence of grazing light**

On smooth surfaces with special lighting conditions (grazing light), we recommend using Kalisil 1909 or alternative special interior emulsion paints, such as Glemalux 1000, Superlux 3000 or Vitasense 9005 – preservative-free.

**Reduced surface sensitivity for vibrant color shades**

When applying matt coats in vibrant color shades, we recommend a coating build-up with Vetrolux 3100. This increases the surface durability while reducing the “writing effect”. Further information about the properties of Vetrolux 3100 and how it is applied is provided in the data sheet.

**Further information**

Follow the instructions on the data sheets of the products used.

## Remark

This Data Sheet is based on extensive development work and years of practical experience. The translation corresponds to the current German version, in compliance with the German laws, regulations, standards and guidelines. Its content does not constitute a contractual legal relationship. The user/buyer is not released from the responsibility of checking our products to ensure they are suitable for the intended application. In addition, our general terms of business apply.

When a new version of this Data Sheet with updated information is published, the previous version no longer applies. The current version is available on our website.
